## Double Shield Expansion Anchor

## PRODUCT DESCRIPTION

The Double is a dual expansion machine bolt anchor particularly suited for materials of questionable strength. It can be used in solid concrete, block, brick, and stone. Job site tests are recommended when used in base materials of questionable strength.

## FEATURES AND BENEFITS

- Performs in base material of questionable strength
- Internally threaded anchor for easy removability and service work
- Corrosion resistant body

## APPROVALS AND LISTINGS

Federal GSA Specification - Meets the descriptive and proof load requirements of

$$
\text { CID A-A 1923A, Type } 3
$$

## GUIDE SPECIFICATIONS

CSI Divisions: 03151-Concrete Anchoring, 04081-Masonry Anchorage and 05090Metal Fastenings. Expansion anchors shall be Double as supplied by Powers Fasteners, Inc., Brewster, NY.

| :--- | :--- |
| Anchor Shield | Zamac Alloy |
| Cone | Zamac Alloy |

## Installation Guidelines

Drill a hole into the base material to the minimum depth required. The tolerances of the drill bit used should meet the requirements of ANSI Standard B212.15. Do not expand the anchor prior to installation.

Do not over drill the hole unless the application calls for a subset anchor.

Insert anchor into the hole, threaded cone end first until the outer sleeve is flush with the surface of the base material.

Position fixture, then insert screw or bolt and tighten. For maximum expansion, the upper cone should protrude slightly before setting. The bolt must engage a minimum of $2 / 3$ of the anchor threads.

1. Tabulated load values are for anchors installed in concrete. Concrete compressive strength must be at the specified minimum at the time of installation,
2. Ultimate load capacities must be reduced by a minimum safety factor of 4.0 or greater to determine allowable working load. Consideration of safety factors of 20 or higher may be necessary depending upon the application such as life safety, overhead and in sustained tensile loading applications.

1. Allowable load capacities listed are calculated using and applied safety factor of 4.0. Consideration of safety factors of 20 or higher may be necessary depending upon the application such as life safety, overhead and in sustained tensile loading applications.
2. Linear interpolation may be used to determine allowable loads for intermediate compressive strengths.
3. Allowable load capacities are multiplied by reduction factors found in the Design Criteria section when anchor spacing or edge distances are less than critical distances.

1. Tabulated load values are for anchors installed in minimum 8-inch wide, minimum Grade N , Type II, lightweight, medium-weight or normal-weight concrete masonry units conforming to ASTM C 90. Mortar must be minimum Type N. Masonry cells may be grouted. Masonry compressive strength must be at the specified minimum at the time of installation ( $\left.f^{\prime} m \geq 1,500 \mathrm{psi}\right)$.
2. Allowable load capacities listed are calculated using and applied safety factor of 5.0. Consideration of safety factors of 20 or higher may be necessary depending upon the application such as life safety, and in sustained tensile loading applications.
3. Anchors with diameters of $3 / 8^{\prime \prime}$ and $1 / 2^{\prime \prime}$ installed in hollow concrete masonry units are limited to one anchor per unit cell.

1. Tabulated load values are for anchors installed in multiple wythe, minimum Grade SW, solid clay brick masonry walls conforming to ASTM C 62 . Mortar must be minimum Type N. Masonry compressive strength must be at the specified minimum at the time of installation ( $f^{\prime} m \geq 1,500 \mathrm{psi}$ ).
2. Allowable load capacities listed are calculated using and applied safety factor of 5.0. Consideration of safety factors of 20 or higher may be necessary depending upon the application such as life safety, and in sustained tensile loading applications.

## DESIGN CRITERIA (ALLOWABLE STRESS DESIGN)

## Combined Loading

For anchors loaded in both shear and tension, the combination of loads should be proportioned as follows:

$$
\left(\frac{N_{u}}{N_{n}}\right)+\left(\frac{V_{u}}{V_{n}}\right) \leq 1
$$

Where: $\quad N_{u}=$ Applied Service Tension Load
$N_{n}=$ Allowable Tension Load
$V_{u}=$ Applied Service Shear Load
$V_{n}=$ Allowable Shear Load

## Load Adjustment Factors for Spacing and Edge Distances ${ }^{1}$

Notes: For anchors loaded in tension and shear, the critical spacing (scr) is equal to 10 anchor diameters $(10 \mathrm{~d})$ at which the anchor achieves $100 \%$ of load. Minimum spacing ( $s \min$ ) is equal to 5 anchor diameters ( $5 d$ ) at which the anchor achieves $50 \%$ of load.

Notes: For anchors loaded in tension, the critical edge distance ( $c_{r r}$ ) is equal to 12 anchor diameters ( $12 d$ ) at which the anchor achieves $100 \%$ of load. Minimum edge distance ( $\mathrm{c}_{\mathrm{min}}$ ) is equal to 8 anchor diameters (8d) at which the anchor achieves 80\% of load.

Notes: For anchors loaded in shear, the critical edge distance $\left(c_{c r}\right)$ is equal to 12 anchor diameters ( 12 d ) at which the anchor achieves $100 \%$ of load.
Minimum edge distance ( $c_{\text {min }}$ ) is equal to 8 anchor diameters ( $8 d$ ) at which the anchor achieves $50 \%$ of load.

## ORDERING INFORMATION

Double Expansion Anchor

| Catalog <br> Number | Rod/Anchor <br> Diameter | Drill <br> Diameter | Overall <br> Length | Minimum <br> Hole Depth | Standard <br> Box | Standard <br> Carton | Wt./ <br> 100 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 9510 | $1 / 4^{\prime \prime}$ | $1 / 2^{\prime \prime}$ | $13 / 8^{\prime \prime}$ | $11 / 4^{\prime \prime}$ | 50 | 500 | 4 |

| 9535 | $3 / 4^{\prime \prime}$ | $11 / 4^{\prime \prime}$ | $315 / 6^{\prime \prime}$ | $31 / 2^{\prime \prime}$ | 10 | 50 | $541 / 2$ |

[^0]:    . Allowable load values found in the performance data tables are multiplied by reduction factors when anchor spacing or edge distances are less than critical distances. Linear interpolation is allowed for intermediate anchor spacing and edge distances between critical and minimum distances. When an anchor is affected by both reduced spacing and edge distance, the spacing and edge reduction factors must be combined (multiplied). Multiple reduction factors for anchor spacing and edge distance may be required depending on the anchor group configuration.
